# Chapter 1: Overview

The TeraRecon Cardiac.Chambers.MR Algorithm is a standalone image processing software device that can be deployed as a Microsoft Windows DLL on off-the-shelf hardware or as a containerized application (e.g., a Docker container) that runs on off-the-shelf hardware or on a cloud platform. Data and images are acquired via DICOM compliant imaging devices.

This medical device is intended to segment Cardiac chambers anatomical structures on MR scans and calculates results from adult patients that undergo Cardiac MR procedures.

The TeraRecon Cardiac.Chambers.MR Algorithm provides the results that can be delivered to the end-user through image viewers such as TeraRecon's Aquarius Intuition system, TeraRecon's Eureka AI Results Explorer, TeraRecon's Eureka Clinical AI Platform, or other image viewing systems like PACS that can support DICOM results generated by the TeraRecon Cardiac Chambers.MR Algorithm. TeraRecon Cardiac.Chambers.MR communicates with other machines with file-based communication.

DICOM, by itself, does not guarantee interoperability. However, the Conformance Statement facilitates a first-level validation for interoperability between different applications supporting the same DICOM functionality.

This Conformance Statement is not intended to replace validation with other DICOM equipment to ensure proper exchange of information intended.

The scope of this Conformance Statement is to facilitate communication with other vendors' Medical equipment. The Conformance Statement should be read and understood in conjunction with the DICOM Standard [DICOM]. However, by itself it is not guaranteed to ensure the desired interoperability and a successful interconnectivity.

The user should be aware of the following important issues:

- Test procedures should be defined to validate the desired level of connectivity.
- The DICOM standard will evolve to meet the users' future requirements.
